**RE: Offsite Hydrologic Analysis
for the General Motors Site and Associated Rail Spur at Stead, Nevada**

Dear Mr. Murphy:

We are pleased to present the results of the offsite hydrologic analysis for the General Motors site and the proposed railroad spur located in Stead, north of downtown Reno, Nevada.

Introduction

The proposed project consists of a 394,000 square-foot building to be constructed on a 26.55-acre site with approximately 4700 lineal feet of industrial track (UPRR Railroad Extension). The site is located on the northwest corner of Echo Avenue and Moya Boulevard and the rail spur extends approximately from the northeast corner of the existing Michelin building to the northeast corner of the proposed GM site. The proposed improvements are contained in a portion of Section 30, T21N, R19E, MDM. See Figure 1, Vicinity Map.

Stantec previously prepared the report, *Drainage Report for General Motors Site*, dated February 2002, that detailed the onsite hydrologic analysis for the General Motors site.

Buildings

Offsite Hydrologic Analysis

Environment

In existing conditions, offsite flows from the north cross the GM site in a southwesterly direction. See Figure 2, Offsite Watershed Boundaries. Offsite watersheds were divided into two basins, Basin 1 and Basin 2. Flows from Basin 1 cross the airport property in a southwesterly direction to the east-west runway in the southern portion of the Reno Stead airport. These flows are then diverted west to the end of runway 8/26, then south through Basin 2 and southwesterly toward the GM site.

Industrial

Transportation

Urban Land

The Stead Drainage Master Plan (SDMP) was used as the basis for the analysis. The U.S. Army Corps of Engineers (COE) Flood Hydrograph package, HEC-1, Version 4.1 was used to perform the hydrologic modeling for the offsite watershed basins for the developed condition 100-year, 24-hour peak flow rates. Basin areas were delineated on USGS Quad Maps and supplemented with 1-foot contour interval topographic mapping. Precipitation within the HEC-1 program was modeled using a balanced storm distribution (PH card). Precipitation values were obtained from the National Weather Service's Precipitation Frequency Study of the United States, NOAA Atlas 14, Volume 1 – Semi-Arid Southwest United States (SSPFS, 1997). The SCS Curve Number method was used to determine curve number values for use in the hydrologic models. Hydrologic

soil groups for each basin were determined using the SCS Soil survey of Washoe County, Nevada, South Part and land uses were obtained from Washoe County and the City of Reno for full build-out conditions. The Lag time for Basin 1 was taken from the Stead Drainage Master Plan (SDMP). Basin SK3, from the SDMP, was re-delineated into Basin 1 to determine the contributing watershed for the GM site. The longest reach length did not change in the re-delineation. The U.S. Bureau of Reclamation Lag time equation was used to determine the lag time for Basin 1. The Time of Concentration equation was used for Basin 2. Given these parameters, the 100-year, 24-hour peak flow rate that reaches the GM site was found to be $Q_{100}=1156$ cfs.

Proposed Improvements

The peak discharge reaches the GM site at its northern boundary. Proposed improvements will divert the flow west along the northern site boundary and then south to the existing drainage path where it will sheet flow in a southwesterly direction to Silver Lake. See Figure 3, Hydraulic Work Map. The diversion, which will consist of a combination of berms and channels, will be contained within an easement located on the Airport property, north of the proposed rail spur and GM site and on offsite property to the west. The channel has a 50-foot bottom width with 3:1 side slopes and an approximate longitudinal slope of 0.08%. A minimum of 1-foot of freeboard is required above the 100-year water surface elevation. A minimum freeboard of 1.5-feet has been provided throughout the length of the channel. Velocities in the channel vary from 0.7 to 5.4 feet per second (fps). The channel will be lined with a PolyPavement soil solidifier to aid in preventing wind and water erosion of soils in the channel. This soil treatment was selected over a permanent channel lining due to the low velocities in the channel and that the channel is a temporary drainage structure. Maintenance of the soil treatment will be the responsibility of the owner.

The final design and grading plans for the offsite diversion channel have been prepared in conjunction with this offsite drainage report and are entitled *GM Service Parts Operations Offsite Drainage Diversion Channel* construction plans. The proposed improvements will eliminate the impact of offsite flows to the site and will convey them to their historic flow pattern.

Easement adjustments and utility relocation designs associated with the channel improvements will be provided by others.

A small watershed located northeast of the adjacent existing Michelin site contributes flows to the structure at the existing Michelin rail spur. Currently a triple 36-inch reinforced concrete pipe (RCP) structure conveys flow under the spur. The capacity of the existing triple 36-inch RCP is approximately 240 cfs. A triple 36-inch RCP structure is proposed for the rail extension crossing located just upstream of the Michelin spur and was designed to convey the same capacity as the existing Michelin spur crossing. The proposed RCP's convey approximately 255 cfs. See Figure 4, Rail Spur Culverts Map. The final design of these culverts are shown on the plans entitled *GM Service Parts Operations Rail Road Spur Project* construction plans.

Conclusions

The offsite 100-year, 24-hour peak flow rate contributing to the GM site for full build-out conditions is $Q_{100}=1156$ cfs. This flow will be diverted around the GM site via a combination of channel and berm improvements. A drainage structure equivalent to the conveyance capacity of the existing culverts located at the east end of the Michelin building will convey flows under the proposed rail spur extension. Final design and grading plans for the proposed improvements have been prepared.

SHEET _____ OF _____

PROJECT LAG time DATE _____

SUBJECT _____ DESIGNED _____ CHECKED _____

$$L = 2032'$$

$$AE = 90 - 75 = 15'$$

$$S = .0074 \text{ or } 0.74\%$$

$$t_c = t_i + t_e$$

$$t_i = \frac{1.8(1.1 - R)L_o^{1/2}}{S^{1/3}}$$

$$R = 0.0132CN - 0.39 = .0132(77) - 0.39 = 0.63$$

$$L_o = 225'$$

$$S = 90 - 87 / 225 = 0.013 = 1.3\%$$

$$t_i = \frac{1.8(1.1 - 0.63)(225)^{1/2}}{(1.3)^{1/3}} = 11.63 \text{ min}$$

$$t_e = \frac{L}{V(60)} = \frac{1807}{(83)(60)} = 36.29 \text{ min}$$

$$S = .0066$$

$$t_c = 11.63 + 36.29 = 47.92$$

$$LAG = 0.6(t_c) = 28.75 / 60 = 0.48 \text{ hr}$$

PLAN DATA

Plan Title: Plan 10
 Plan File : p:\CIVIL\80100532\HEC-RAS\GMOFFSITE.p10

Geometry Title: GM OFFSITE DITCH (ADJUSTED BERM)
 Geometry File : p:\CIVIL\80100532\HEC-RAS\GMOFFSITE.g03

Flow Title : GM OFFSITE
 Flow File : p:\CIVIL\80100532\HEC-RAS\GMOFFSITE.f01

Plan Summary Information:

Number of: Cross Sections = 12 Multiple Openings = 0
 Culverts = 0 Inline weirs = 0
 Bridges = 0

Computational Information

Water surface calculation tolerance = 0.003
 Critical depth calculation tolerance = 0.003
 Maximum number of iterations = 20
 Maximum difference tolerance = 0.1
 Flow tolerance factor = 0.001

Computation Options

Critical depth computed at all cross sections
 Conveyance Calculation Method: At breaks in n values only
 Friction Slope Method: Average Conveyance
 Computational Flow Regime: Subcritical Flow

FLOW DATA

Flow Title: GM OFFSITE
 Flow File : p:\CIVIL\80100532\HEC-RAS\GMOFFSITE.f01

Flow Data (cfs)

River	Reach	RS	PF 1
TEMP DITCH	GM SITE	1200	1156

Boundary Conditions

River	Reach	Profile	Upstream	Downstream
TEMP DITCH	GM SITE	PF 1	Normal s = .0008	Normal s = .0008

ERRORS WARNINGS AND NOTES

Errors Warnings and Notes for Plan : Plan 10

River: TEMP DITCH Reach: GM SITE RS: 1200 Profile: PF 1

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.
